Abstracts

The global waste-to-energy market was valued at \$35.1 billion in 2019, and is projected to reach \$50.1 billion by 2027, growing at a CAGR of 4.6% from 2020 to 2027. Waste-to-energy is the process of energy generation by the primary treatment of municipal solid waste. This process produces electricity or heat directly by combustion. In addition, it produces combustible fuel commodities such as methanol, methane, synthetic fuels, or ethanol.

The boom of the worldwide waste-to-energy market is attributed to increase in demand for incineration technique and growth in public WtE expenditure. Moreover, rise in inclination of customers in the direction of efficient and clean WtE conversion strategies, which include incineration, gasification, pyrolysis, and numerous biochemical treatments, inclusive of aerobic and anaerobic digestion, is anticipated to drive the market growth. However, rise in concerns related to the environmental risks associated with the incineration is expected to have a negative effect on the overall market growth. On the contrary, rise in investments in R&D activities to make certain reliability on environmental friendly energy generation is expected to offer lucrative opportunities for the market growth.

The global WtE market is segmented on the basis of technology and region. On the basis of technology, the market is divided into thermal, biochemical, and others. The thermal technology is further segmented into combustion or incineration, gasification, and pyrolysis. By region, the global waste-to-energy market is analyzed across North America, Europe, Asia-Pacific, and LAMEA.
