Abstracts

Virtual training is a methodology in which a simulated virtual environment is created to test the capabilities of a trainee that can contribute to the learning process. It can be of two types, namely, instructor-led training and non-instructor-led training. Simulation is the imitation of the processes of a real-world operation or system over time.

Further, simulation is used to create a virtual environment that can be used for training purposes. Virtual training and simulation tools comprise hardware and software. Hardware components include headsets, combat tools, hand-gloves, hearing aids, mannequins, gaming consoles, and others; while software components are programs or set of instructions that are used to perform the activities in the system.

The virtual training and simulation market is primarily driven by growth in awareness among end users about the benefits of virtual training & simulation and increased spending by various end users such as defense, healthcare, and education due to higher budget allocation. However, there are some regions such as North African countries, which are unable to adopt this technology due to either lack of necessary infrastructures or limited knowledge about the technology.

Manufacturers in the virtual training and simulation market lack in terms of investments in R&D, which limits the innovation potential and market expansion. However, advancements in technology, rise in number of internet users, and widening scope of technology in other industries such as energy, transportation, and mining are estimated

to provide significant growth opportunities to the key players operating in the global virtual training and simulation market.

The virtual training and simulation market is segmented on the basis of component, end user, and region. By component, it is categorized hardware and software.
