Abstracts

Summary

3-aminopropyltriethoxysilane is produced by triethoxysilane and NH₃ in autoclave reaction.

In the acrylonitrile process, cyanoethylsilane is thoxylated and then hydrogenated over Raney nickel at high hydrogen pressure.

The ammonia substitution process starts from chloropropyltriethoxysilane, and requires a large excess and high pressure of NH₃. With a 75-fold molar quantity of NH₃ with respect to the chloro component, selectivities for the primary amine of up to 8% have been reported. The correspondingly low space-time yields can only be improved if increased proportions of di- and even trisubstituted downstream products of the initially formed aminopropylsilane are acceptable.

3-Aminopropyltriethoxysilane is the aminosilane used as adhesion promoter for both adhesive and sealant formulations to improve substrate adhesion.

According to APO Research, The global 3-aminopropyltriethoxysilane market was valued at US\$ million in 2023 and is anticipated to reach US\$ million by 2030, witnessing a CAGR of xx% during the forecast period 2024-2030.
