Abstracts

Pheromones are chemicals produced as messengers that affect the behaviour of other individuals of insects or other animals. They are usually wind borne but may be placed on soil, vegetation or various items. It has been found that pheromones may convey different signals when presented in combinations or concentrations. Pheromones differ from sight or sound signals in a number of ways. They travel slowly, do not fade quickly, and are effective over a long range. Sound and sight receptors are not needed for pheromone detection, and pheromone direction is not limited to straight lines.
