Abstracts

Air cooler, also known as, evaporative cooler, swamp cooler, desert cooler and wet air cooler, uses the hot air in the room and water in order to produce cooler air. It uses the evaporating technique in order to produce the cool air, earning the name evaporative cooler.

Evaporative cooling employs water's enthalpy of vaporization, where the temperature of dry air can be dropped by putting it through transition of liquid water to water vapor. The system uses water in to wet absorptive on the sides of the cooler. A fan is used to send the water through the absorptive pads which cools the air by making it more humid and then blows it out to the room. A cooler uses less energy as it only has two major components which need powering; a water pump and a fan. It also needs a constant supply of water in order to keep the pads wet and cool the air.
