Abstracts

Brazing is a metal joining process utilizing a filler metal that melts above 840°F and below the melting point of the base metals. The American Welding Society defines brazing as “a group of joining processes that produces coalescence of materials by heating them to the brazing temperature in the presence of a filler metal having a liquidus above 840°F (450°C) and below the solidus of the base metal. The filler metal is distributed between the closely fitted faying surfaces of the joint by capillary action.” Brazing then must meet each of three criteria: Brazing Materials include powders, pastes, coated-rods, preformed, rings, wire and fluxes. The major filler metal contain silver brazing alloys, Copper brazing alloys, Aluminum brazing alloys, nickel brazing alloys.
