Abstracts

Double column machining center consist of the high precision main structure spine bed, the column, the spindle head, the cross slide and the worktable. The double column type machining center is a one of precision metal processing machines that can handle multiple machining tasks at once. Regarding the milling process of a double column type machining center, it is a process of using a rotating tool to remove workpiece material by pushing the tool into one or more workpieces. The cutting process can be done in different directions, and these directions are based on the box, just like a lathe in the way of a box. In addition to turning, milling also covers a variety of operations, ranging from a single tiny part to heavy and large milling tasks. The double column type machining center is designed to process large and thick workpieces. Under normal circumstances, these workpieces will bring large and intolerant vibration to the frame, and cause uncontrollable deviation from the target accuracy. Therefore, the use of two columns can reduce cutting vibration and increase the rigidity of the tool to obtain the best machining effect.
