## Abstracts

Amino Acid Analyzer uses classic cation exchange chromatography and ninhydrin post-column derivatization to analyze the protein hydrolysate and the content of various free amino acids. The basic structure of the instrument is similar to ordinary HPLC, but the details are optimized for amino acid analysis.

Usually subdivided into two systems: proteolysis analysis system (sodium salt system) and free amino acid analysis system (lithium salt system), using different concentrations and pH values of sodium citrate or lithium citrate for gradient elution. Among them, the sodium salt system can analyze up to about 25 amino acids at a time, which is faster and has a good baseline flatness; the lithium salt system can analyze up to about 50 amino acids at a time, which is slower, and the baseline is generally not as good as the sodium salt system.
