Summary

The transmission filter is a vital part of that system and is situated above the transmission pan, which catches any excess fluid, and below a pickup tube that connects to the oil pump, which regulates the pressure of fluid in the transmission. The transmission filter functions as a sieve to collect contaminants like dirt and debris before sending lubricating fluid to the transmission itself. Although every vehicle has its own optimal maintenance needs that can usually be located in the owner's manual, the general consensus among mechanics is that the transmission filter and fluid should be replaced every 25,000 miles.
