Summary

Borosilicate glass is a type of glass with the main glass-forming constituents of silica and boron trioxide. Borosilicate glasses are known for having very low coefficients of thermal expansion, making them resistant to thermal shock, more than any other common glass. Such glass is less subject to thermal stress and is commonly used for the construction of ampoule bottle, etc. Tip: At present, many players directly manufacture their own borosilicate glass into downstream products such as laboratory instruments and pharmaceutical packaging. The added value has increased several times and the data cannot be counted. Therefore, the report only deals with primary forms of products, namely primary forms of glass tubes, glass rods, and glass plates.
