## Abstracts

A ceramic capacitor is a fixed value capacitor in which ceramic material acts as the dielectric. Ceramics were one of the first materials to be used in the producing of capacitors, as it was a known insulator. It is constructed of two or more alternating layers of ceramic and a metal layer acting as the electrodes. The composition of the ceramic material defines the electrical behavior and therefore applications.

Much geometry were used in ceramic capacitors, of which some, like ceramic tubular capacitors and barrier layer capacitors are obsolete today due to their size, parasitic effects or electrical characteristics. Ceramic capacitors are usually made with very small capacitance values, typically between 1nF and 1 $\mu$ F, although values up to 100 $\mu$ F are possible. Ceramic capacitors are also very small in size and have a low maximum rated voltage. They are not polarized, which means that they may be safely connected to an AC source. Ceramic capacitors have a great frequency response due to low parasitic effects such as resistance or inductance.

According to APO Research, The global Ceramic Capacitor market is projected to grow from US\$ million in 2024 to US\$ million by 2030, at a Compound Annual Growth Rate (CAGR) of % during the forecast period.
