Summary

Chip-on-Flex, or COF, refers to the semiconductor assembly technology wherein the microchip or die is directly mounted on and electrically connected to a flexible circuit (a circuit built on a flexible substrate instead of the usual printed circuit board). Thus, in a COF assembly, the microchip doesn't have to go through all the traditional assembly steps required for individual IC packaging. This simplifies the over-all process of designing and manufacturing the final product while improving its performance as a result of the shorter interconnection paths.
