Abstracts

Collagen widely exists in all multicellular animals. It is the most abundant protein in the body, accounting for about a quarter of the total protein in the human body. It is an extracellular protein in almost all tissues. It exists in the form of insoluble fibers and has high tensile capacity. It has great influence on the formation of skin, blood vessels, bones, tendons and cartilage in animals and human bodies. It is an important material of connective tissue and a major factor determining the toughness of connective tissue. It plays a role of binding tissue in animal cells.

Colloquially, collagen is only a part of collagen. Because the molecular weight of collagen ranges from 500 to 30000, the human body can directly absorb it. If it is too small, it is oligopeptide or polypeptide, which is no big difference from amino acid for human body. The larger molecular weight is hundreds of thousands to millions of macromolecules, which is collagen. Human body can't absorb collagen, which is the root of understanding that 'collagen' can't be absorbed.
