Abstracts

Competent cells are bacteria which can accept extra-chromosomal DNA or plasmids. Cells can be made competent in several ways. One such way is to 'shock' it, which involves cooling the bacteria in a Calcium Chloride bath at 0 degrees Celsius, then quickly heating it to around 47 degrees Celsius for approximately 90 seconds (too long will denature the cell membrane, killing the bacteria). The calcium chloride ions neutralize the repulsion between the negatively charged phospholipid heads of the cell membrane and the negatively charged phosphate groups on the DNA. The quick heat shock creates a thermal gradient which, in turn, creates a draft leading into the cell, allowing extra-chromosomal DNA (such as plasmids) to enter the cell, allowing the bacterium to be genetically modified.

According to APO Research, The global Competent Cells market is projected to grow from US\$ million in 2024 to US\$ million by 2030, at a Compound Annual Growth Rate (CAGR) of % during the forecast period.

Global Competent Cells key players include Beijing TransGen Biotech, Merck KGaA, Thermo Fisher Scientific, Agilent Technologies, etc. Global top four manufacturers hold a share nearly 30%.

North America is the largest market, with a share about 10%, followed by Asia-Pacific and Europe, both have a share about 20 percent.

In terms of product, Chemically Competent Cells is the largest segment, with a share nearly 65%. And in terms of application, the largest application is Protein Expression, followed by Subcloning & Routine Cloning, Phage Display Library Construction,

Toxic/Unstable DNA Cloning, etc.
