Abstracts

Compound semiconductors are semiconductors that are made from two or more elements. Silicon is made from a single element, and therefore is not a compound semiconductor.

Most compound semiconductors are from combinations of elements from Group III and Group V of the Periodic Table of the Elements (GaAs, GaP, InP and others). Other compound semiconductors are made from Groups II and VI (CdTe, ZnSe and others). It is also possible to use different elements from within the same group (IV), to make compound semiconductors such as SiC.

According to APO Research, The global Compound Semiconductor market was estimated at US\$ million in 2023 and is projected to reach a revised size of US\$ million by 2030, witnessing a CAGR of xx% during the forecast period 2024-2030.

Japan is the largest producer of Compound Semiconductor, with a market share nearly 25%. It was followed by North America with 20%. Sumitomo Electric Industries, SCIOCS, Mitsubishi Chemical, Dow Corning and Shin-Etsu Chemical are the top 5 manufacturers of industry, and they had about 40% combined market share.
