Summary

Cytotoxic drugs inhibit or prevent the function of cells. Cytotoxic drugs are primarily used to treat cancer, frequently as part of a chemotherapy regime. Recently, their uses have expanded to treat certain skin conditions (e.g., psoriasis), rheumatoid and juvenile rheumatoid arthritis, and steroid-resistant muscle conditions. The most common forms of cytotoxic drugs are known as antineoplastic. The terms 'antineoplastic' and 'cytotoxic' are often used interchangeably.

Cytotoxic drugs can prevent the rapid growth and division of cancer cells. They can also affect the growth of other quick dividing cells in the body, like hair follicles and the lining of the digestive system. As a result of the treatment, many normal cells are damaged along with the cancer cells.
