Summary

Light propagates at varying speeds dependent on a given material's index of refraction. More specifically, it appears to slow down when it moves from an index of lower refraction like air into a medium with a higher refractive index. If we could somehow modify the the refractive index, we could thus control the propagation of light through a medium. One such phenomenon is the electro-optic effect that allows modifying the refractive index of a medium by subjecting it to an electric field. Electro-optic modulators exploit this effect by sending an electric signal through a medium (typically a crystal) to shift the refractive index and therefore change properties of an incoming light beam.
