### Summary

Epichlorohydrin (ECH) is a clear colorless liquid with an irritating chloroform-like odor. It is a highly reactive organochlorine compound and is used in the production of glycerol, plastics, epoxy glues and resins, and elastomers. In contact with water, epichlorohydrin hydrolyzes to 3-MCPD, a carcinogen found in food. Epichlorohydrin is readily biodegradable and is not expected to persist in the environment. Epichlorohydrin has a low potential to bioaccumulate, and is not expected to adsorb to soil or sediment. In water, epichlorohydrin will be rapidly broken down by both biological and non-biological mechanisms. In air, epichlorohydrin will rapidly dissipate and break down. In the case of soil exposure, epichlorohydrin will mostly remain in groundwater rather than soil particulates, and will be rapidly degraded.

ECH was first described in 1848 and was isolated during studies on reactions between glycerol and gaseous hydrogen chloride.

ECH is classified by several international health research agencies and groups as a probable or likely human carcinogen in humans. Prolonged oral consumption of high levels of epichlorohydrin could result in stomach problems and an increased risk of cancer.

According to APO Research, The global Epichlorohydrin market was estimated at US\$ million in 2023 and is projected to reach a revised size of US\$ million by 2030, witnessing a CAGR of xx% during the forecast period 2024-2030.
