Summary

1/f noise, or flicker noise, is the dominant noise for deep sub-micron CMOS, BJT, FET and HBT devices. It can significantly impact the performance of analog/RF circuits. As an example, 1/f noise becomes phase noise in an oscillator and causes stable issues. A noisy LO signals can severely degrade a receiver's dynamic range and selectivity. Accurate measurement and modeling of 1/f noise are critical to analog/RF circuit designs. However, this measurement is particular difficult, since the measurement system itself can easily introduce other noise sources. Therefore, an integrated measurement system with high stability and low system noise is absolutely critical for accurate 1/f noise measurement
