Abstracts

Friction Welding Machine is a type of machine which uses friction welding technology to work. Traditionally, friction welding is carried out by moving one component relative to the other along a common interface, while applying a compressive force across the joint. The friction heating generated at the interface softens both components, and when they become plasticised the interface material is extruded out of the edges of the joint so that clean material from each component is left along the original interface. The relative motion is then stopped, and a higher final compressive force may be applied before the joint is allowed to cool. The key to friction welding is that no molten material is generated, the weld being formed in the solid state.

According to APO Research, The global Friction Welding Machine market was estimated at US\$ million in 2023 and is projected to reach a revised size of US\$ million by 2030, witnessing a CAGR of xx% during the forecast period 2024-2030.

In the coming years there is an increasing demand for friction welding machine in the regions of Germany, USA, China and Japan that is expected to drive the market for more friction welding machine. Increasing of welding equipment expenditures, more-intense competition, launches in introducing new products, increasing of spending on automotive and general machine industry, retrofitting and renovation of old technology, increasing adoption of friction welding machine will drive growth in global market.

For the major players of friction welding machine, KUKA maintained its first place in the ranking in 2019, followed by Branson (Emerson) and Shenzhen Izumi Machine. The Top 5 players accounted for 43% of the Global friction welding machine revenue market share in 2019.
