Summary

Homomorphic Encryption (HE, homomorphic encryption) is a special encryption mode in cryptography. Homomorphic Encryption allows users to send the encrypted cipher text to any third party for calculation, and does not need to be decrypted before calculation. Calculate on the cipher text. Although the concept of homomorphic encryption first appeared 30 years ago, the first fully homomorphic encryption framework that supports arbitrary operations on cipher text appeared late, and was proposed by Craig Gentry in 2009.

Homomorphic Encryption is a form of encryption that allows an encrypted file to be calculated to generate an encrypted result that matches the result of the operation performed on the plaintext after decryption. The purpose of Homomorphic Encryption is to allow calculations on encrypted data.
