Summary

Hydrogen sulfide, CAS 7783-06-4, is a colorless, flammable, extremely hazardous gas with a “rotten egg” smell. It occurs naturally in crude petroleum, natural gas, and hot springs. In the report, we count hydrogen sulfide existing as a liquid compressed gas. We mainly cover high purity hydrogen sulfide.

Hydrogen sulfide is produced in technical (98.5%) and purified (99.5% minimum) grades. It is commercially available by two typical approaches: recovery from gas mixtures and chemical means. Natural gas and gases associated with crude oil contain varying amounts of hydrogen sulfide from trace amounts to 70–80%. Recovery of hydrogen sulfide from natural gas, manufactured gas operations, or as a byproduct of petroleum refining is the main nonnatural source of hydrogen sulfide. These sources are generally used as raw materials for NaHS. These sources are generally used as raw materials for NaHS. We will analyze this market in detail in 1.8.

In addition, hydrogen sulfide (H₂S) is a very toxic and pungent gas that causes problems in both the upstream and downstream oil industry and gas industry. Hydrogen sulfide scavengers can remove the H₂S from the upstream and downstream oil industry and gas to reduce corrosion.

In addition, the price of pipeline transportation H₂S is also very cheap. We will analyze pipe hydrogen sulfide in 1.9.
