Abstracts

An Industrial Power Tools is a tool that is actuated by an additional power source and mechanism other than the solely manual labor used with hand tools. The most common types of Industrial Power Tools use electric motors. Internal combustion engines and compressed air are also commonly used. Other power sources include steam engines, direct burning of fuels and propellants, or even natural power sources like wind or moving water. Tools directly driven by animal power are not generally considered Industrial Power Tools. Industrial Power Tools are used in industry, in construction, in the garden, for housework tasks such as cooking, cleaning, and around the house for purposes of driving (fasteners), drilling, cutting, shaping, sanding, grinding, routing, polishing, painting, heating and more. Industrial Power Tools are classified as either stationary or portable, where portable means hand-held. Portable Industrial Power Tools have obvious advantages in mobility. Stationary Industrial Power Tools however often have advantages in speed and accuracy, and some stationary Industrial Power Tools can produce objects that cannot be made in any other way. Stationary Industrial Power Tools for metalworking are usually called machine tools. The term machine tool is not usually applied to stationary Industrial Power Tools for woodworking, although such usage is occasionally heard, and in some cases, such as drill presses and bench grinders, exactly the same tool is used for both woodworking and metalworking.
