Abstracts

Material handling robots are used in various streams such as pick and place, palletizing/depalletizing, and the packaging sector. They are used to improve material handling efficiency, flexibility, and constancy in the manufacturing processes. The use of material handling robots in a production plant not only reduces the ergonomic threats but also helps to improve the lean management system of the business.

Material handling robots can manage case-picking functions and can also handle carts for contentment centers or manufacturing process for parts to the lines of operation. The lifting capacity of material handling robots can be over 150 lbs (68 kg). The twin arm manipulator can lift and handle almost every warehoused material. These robots help reduce workplace fatigue and injury.

Increases in the number of manufacturing facilities and the growth of production plants are among the major drivers of the material handling robotics market. The ability to simplify and decrease time consumption in production functions, while enhancing dependability, accuracy, and the involvement of low task force are the additional market drivers. The development of the material handling robotics market is expected to rise due to the suitability and the substantial cost reduction offered by these robots. Sorting systems, sliding belts, picking systems, and material putting robots are some of the material handling robots that have gained significance in recent years. The initial investment required for material handling robots is high, but in the long run these robots provide a competitive edge.
