### Summary

Microcrystalline wax, any petroleum-derived plastic material that differs from paraffin waxes in having much finer and less-distinct crystals and higher melting point and viscosity. Microcrystalline waxes may be made from the residue of crude petroleum by refining; or they may be made from petroleum jelly by removing the oil with a solvent. Their physical properties may be controlled by the temperature of the solvents. Methods of separation include solvent dilution, chilling, centrifuging, filtering, and various combinations of these.
