## Abstracts

Nanopharmaceuticals are colloidal particles of 10 to 1,000 nanometers (1 micron) in size. They are widely used in drug delivery. Nanopharmaceuticals are diverse both in their shape and composition and often offer an advantage as compared to their “bulk” counterparts primarily because of size.

There are two types of nanopharmaceuticals: (1) those where the therapeutic molecules are themselves the drug (i.e., the therapeutic compound itself also functions as its own carrier); and (2) those where the therapeutic molecules are directly coupled (functionalized, entrapped, or coated) to a nanoparticle carrier.

According to APO Research, The global Nanopharmaceuticals market is projected to grow from US\$ million in 2024 to US\$ million by 2030, at a Compound Annual Growth Rate (CAGR) of % during the forecast period.
