Abstracts

In recent years, non-radioactive nucleic acid labeling and detection methodologies have become available in response to a desire by researchers and their institutions to move away from the use of radioisotopes. Advancements made in the areas of chemiluminescence and fluorescence have allowed for an easier transition. In non-radioactive assays, signal is generated through an enzymatic reaction with a chemiluminescent or chromogenic substrate; alternatively, detection can occur through the appropriate excitation and emission of a fluorophore-labeled probe.
