### Summary

Peat is a dark fibrous material created when 'decomposition fails to keep pace with the production of organic matter'. Although peat is created under specific conditions (waterlogging, lack of oxygen or nutrients, high acidity or low temperatures), peat can be found in many types of wetlands. Marshes, swamps, floodplains and coastal wetlands may contain peat.

Peat is soft and easily compressed. Under pressure, water in the peat is forced out. Upon drying, peat can be used as fuel. It has industrial importance as a fuel in some countries, such as Ireland and Finland, where it is harvested on an industrial scale. In many countries, including Ireland and Scotland, where trees are often scarce, peat is traditionally used for cooking and domestic heating. Stacks of drying peat dug from the bogs can still be seen in some rural areas. Peat's insulating properties make it of use to industry.
