Summary

Plasma display panels (PDP) are a ?at panel display technology that uses small cells containing electrically charged ionized gases, or plasmas, to produce an image. A plasma display consists of millions of tiny gas-filled compartments, or cells, between two panels of glass.

This technology came out as a concept by a Hungarian engineer in 1936. Until 1992, Fujitsu introduced the world's first 21-inch (53 cm) full-color display. After around 2 decades' commercialization, PDP used to be a strong competitor to CRT and LCD panel.

With the advantage such as: capable of producing deeper blacks allowing for superior contrast ratio; wider viewing angles than those of LCD; less visible motion blur; less expensive for the buyer per square inch than LCD, PDP used to have a very strong marketing drive. But also with the significant disadvantages: screen burn-in and image retention; panel couldn't be cut small as LCD can, also heavier than those coming display advance products like LCD, LED, OLED. When Samsung and Changhong LTD announced halt the panel production in 2014, plasma display panel walked out the stage of history.

The data of this report about PDP are all based on the 42 inch.

According to APO Research, The global Plasma Display Panel market is projected to grow from US$ million in 2024 to US$ million by 2030, at a Compound Annual Growth Rate (CAGR) of % during the forecast period.
