## **Abstracts**

Power-factor correction increases the power factor of a load, improving efficiency for the distribution system to which it is attached. Linear loads with low power factor (such as induction motors) can be corrected with a passive network of capacitors or inductors. Non-linear loads, such as rectifiers, distort the current drawn from the system. In such cases, active or passive power factor correction may be used to counteract the distortion and raise the power factor. The devices for correction of the power factor may be at a central substation, spread out over a distribution system, or built into power-consuming equipment.

According to APO Research, The global Power Factor Correction Devices market is projected to grow from US\$ million in 2024 to US\$ million by 2030, at a Compound Annual Growth Rate (CAGR) of % during the forecast period.

Global Power Factor Correction Devices main players are ABB, Schneider, Siemens, Eaton, etc. Global top four manufacturers hold a share nearly 40%. Asia-Pacific is the largest market, with a share above 50%.
