Abstracts

According to the National Institutes of Health (NIH), precision medicine is 'an emerging approach for disease treatment and prevention that takes into account individual variability in genes, environment, and lifestyle for each person.' This approach will allow doctors and researchers to predict more accurately which treatment and prevention strategies for a particular disease will work in which groups of people. It is in contrast to a 'one-size-fits-all' approach, in which disease treatment and prevention strategies are developed for the average person, with less consideration for the differences between individuals.

Although the term 'precision medicine' is relatively new, the concept has been a part of healthcare for many years. For example, a person who needs a blood transfusion is not given blood from a randomly selected donor; instead, the donor's blood type is matched to the recipient to reduce the risk of complications. Although examples can be found in several areas of medicine, the role of precision medicine in day-to-day healthcare is relatively limited. Researchers hope that this approach will expand to many areas of health in coming years.

According to APO Research, The global Precision Medicine market is projected to grow from US\$ million in 2024 to US\$ million by 2030, at a Compound Annual Growth Rate (CAGR) of % during the forecast period.

The classification of precision medicine includes diagnostics and therapies, and the proportion of diagnostics is about 67%.

Precision Medicine is used for oncology, neurosciences, immunology, respiratory and

other field. The most proportion of precision medicine is for oncology, and the market share is about 30%.

Market competition is intense. Johnson & Johnson, Roche, Labcorp, Abbott Laboratories and Novartis are the leaders of the industry, with about 56% market shares.
