## Abstracts

Burner is a device that controls the mixing of air with a combustible fuel to produce a stable flame pattern. In the report, we focused on burners used in oil and chemical industry.

A flare system collects and discharges gas from atmospheric or pressurized process components to the atmosphere to safe locations for final release during normal operations and abnormal conditions. A flare system consists of a flare stack and pipes that feed gas to the stack. The type and amount of gas or liquids in the flare stack governs the sizing & brightness of the flare.

Thermal oxidizers reduce air pollution emissions from a variety of industrial processes. Using the principle of “thermal oxidation,” a combustion process, the contaminants within the polluted exhaust gas react with oxygen in a temperature controlled environment. The chemical oxidation reaction destroys the contaminants in the polluted exhaust gas before discharging it back into the atmosphere. What is released is an innocuous emission of CO<sub>2</sub>, water vapor, and heat.

According to APO Research, The global Process Burners, Process Flares & Thermal Oxidizer Systems market was estimated at US\$ million in 2023 and is projected to reach a revised size of US\$ million by 2030, witnessing a CAGR of xx% during the forecast period 2024-2030.
