### Summary

RGB lasers are show laser systems with exactly three-color modules: red, green and blue. Commonly used wavelengths of semiconductor laser diodes for RGB laser manufacturing are 635-660nm for red color, 520nm for green color and 445-460nm for blue color lasers. Laser modules include a separate photo detector device which is used to 'measure' the light output and provide feedback to the driver. The advantages of laser sources include high definition, high brightness, and focus-free projection. The RGB laser module are suitable for a variety of applications because of its stable optical and electrical characteristics, such as small projectors, Laser Lighting and various industrial and medical light source.
