Summary

RGB lasers are show laser systems with exactly three-color modules: red, green and blue. Commonly used wavelengths of semiconductor laser diodes for RGB laser manufacturing are 635-660nm for red color, 520nm for green color and 445-460nm for blue color lasers. Laser modules include a separate photo detector device which is used to 'measure' the light output and provide feedback to the driver. The advantages of laser sources include high definition, high brightness, and focus-free projection. The RGB laser module are suitable for a variety of applications because of its stable optical and electrical characteristics, such as small projectors, Laser Lighting and various industrial and medical light source.

According to APO Research, The global RGB Laser Modules market was estimated at US$ million in 2023 and is projected to reach a revised size of US$ million by 2030, witnessing a CAGR of xx% during the forecast period 2024-2030.
