Abstracts

An endoscopy (looking inside) is used in medicine to look inside the body. The endoscopy procedure uses an endoscope to examine the interior of a hollow organ or cavity of the body. Unlike many other medical imaging techniques, endoscopes are inserted directly into the organ.

Direct visualisation of a diseased area inside the body can be achieved by using a telescope or tube passed through a natural orifice or through a small incision in the skin. This may be rigid employing a series of lenses, or flexible employing optic fibres to convey the illuminating light, and to convey the image to the eyepiece.

The endoscope is often fitted with one or more extra channels through which operating instruments may be passed such as electrosurgery probes, or manipulating, grasping or crushing forceps. These channels may also be used for delivering fluids or gas, providing suction, or passing sampling catheters or laser light pipes.
