Abstracts

Shotcrete Accelerator is a chloride free, non-caustic accelerator primarily used in shotcrete applications. Shotcrete Accelerator has two main effects on shotcrete. It provides rapid setting or stiffening so the newly applied shotcrete can begin to support almost immediately. It also provides high early strength to allow loading at an early stage. Accelerator is a kind of chemical admixture that makes cement set quickly. It can set and harden cement in a short period of time. It is mainly used in sprayed concrete and sprayed mortar projects. Shotcrete has many advantages in construction and rock support. It has become a very important and necessary measure in modern underground engineering. In particular, the development of wet-mix shotcrete technology has greatly expanded the use of shotcrete in underground engineering. range. The main function of the liquid accelerator for sprayed concrete is to accelerate the setting of the concrete mixture and improve the early strength, which can increase the thickness of the spray layer and shorten the time for spraying the next layer. With economic development and technological progress, the application of accelerators has become more and more extensive, such as mines, tunnels, leak plugging, underground engineering, etc.
