Summary

Emission control catalysts are now used on all types of internal combustion engines, as well as in a number of stationary applications. Catalytic reactors for mobile applications, known as catalytic converters, utilize catalyst-coated monolithic substrates. Terms which are used to characterize the catalyst performance include conversion efficiency, light-off temperature, and space velocity.

Following the success in mobile engine applications, catalyst technologies were introduced for stationary applications, for the control of volatile organic compounds (VOC) and NO_x emissions. The list of catalyst applications covers such emission sources as chemical plants, painting and coating processes, ovens, printing, dry cleaning, power generation, and, last but not least, stationary engines. Examples of catalyst technologies for stationary engines include non-selective catalytic reduction (NSCR) of NO_x from rich burn natural gas engines and selective catalytic reduction (SCR) of NO_x by ammonia from diesel engines.
