Summary

Superconductor is a material that can conduct electricity or transport electrons from one atom to another with no resistance. This means no heat, sound or any other form of energy would be released from the material when it has reached 'critical temperature' (T_c), or the temperature at which the material becomes superconductive. However, most materials must be in an extremely low energy state (very cold) in order to become superconductive.

According to APO Research, The global Superconductor market was estimated at US\$ million in 2023 and is projected to reach a revised size of US\$ million by 2030, witnessing a CAGR of xx% during the forecast period 2024-2030.
