Abstracts

Flame retardants are compounds added to manufactured materials, such as plastics and textiles, and surface finishes and coatings that inhibit, suppress, or delay the production of flames to prevent the spread of fire. They may be mixed with the base material (additive flame retardants) or chemically bonded to it (reactive flame retardants). Mineral flame retardants are typically additive while organo halogen and organophosphorus compounds can be either reactive or additive.

TCPP is an additive flame retardant, i.e. it is physically combined with the material being treated rather than chemically combined. The amount of flame retardant used in any given application depends on a number of factors such as the flame retardancy required for a given product, the effectiveness of the flame retardant and synergist within a given polymer system, the physical characteristics of the end product (e.g. colour, density, stability, etc.) and the use to which the end product will be put.

TCPP, the chemical name is tris (2-chloroisopropyl) phosphate, is low cost chlorine and phosphorous based flame retardant. It has the best hydrolysis stability among currently available halogenated organic phosphates. Cannot dissolve in water, dissolve in most organic solvent, and have good compatibility with resins. TCPP flame retardant soluble in alcohols, benzene, esters and carbon tetrachloride. insoluble in water and aliphatic hydrocarbon. It has low toxicity, non-corrosive, moisture-proof and anti-static.

According to APO Research, The global TCPP Flame Retardant market was estimated at US\$ million in 2023 and is projected to reach a revised size of US\$ million by 2030, witnessing a CAGR of xx% during the forecast period 2024-2030.
