Abstracts

Resveratrol is a phenolic compound, a stilbene, created by plants in response to injury, infection, and fungal attack. It exists in two forms, the trans- and cis- molecule forms, with trans-resveratrol being the highly-absorbable form. The compound is regarded as having powerful antioxidant effects, thereby supporting health at the cellular level.

Trans-resveratrol is one of the isomers (molecule structures) of resveratrol, with cis-resveratrol being the other. Simply put, trans-resveratrol occurs with hydroxide atoms on opposite sides of the molecule, where cis- resveratrol has the hydroxide atoms on the same side.
