Abstracts

A triazine is class of nitrogen-containing heterocycles. The parent molecules' molecular formula is $C_3H_3N_3$. They exist in three isomeric forms, 1,3,5-triazines being common.

MMA Triazine is a cyclic tertiary triamine. It is mainly used as a scavenger for sour gases like H_2S and mercaptans in gaseous or liquid hydrocarbon streams.

MEA-triazine is the most commonly used chemistry for applications requiring a non-regenerative H_2S scavenger. Other chemistries are available (MMA-triazine, glyoxal, zinc-based, iron-based, and others) but MEA-triazine has the highest market share because it is the lowest cost in use solution. Triazines are low cost in use despite the fact that the molar efficiency of the chemistry in capturing H_2S is significantly below theoretical maximum efficiency.

According to APO Research, The global Triazine market was estimated at US\$ million in 2023 and is projected to reach a revised size of US\$ million by 2030, witnessing a CAGR of xx% during the forecast period 2024-2030.

North America is the major market for triazine, accounting for over 40% of the market share. Europe is next with about 25%.

Hexion, Eastman, Baker Hughes, Sintez Oka and others are the major players, with the top three accounting for about 20% of the market.
