Summary

UV sensors, which convert light (photons) into electric current, are elements highly sensitive to the wavelength of light in the ultra-violet region. Ultra-violet light is classified as “UV-A”, “UV-B” and “UV-C”, depending on the wavelength and as the wavelengths become shorter more damage is caused to life forms. These sensors are used in industrial applications as light source monitors for equipment that sterilizes using UV-C with a short wavelength. Sensors used in our daily lives are primarily intended for detecting UV-A and UV-B ranges with longer wavelengths from UV light that is included in the sun's rays.
