Abstracts

Vacuum-assisted biopsy is a minimally invasive procedure that allows for the removal of multiple tissue samples. However, unlike core needle biopsy, which involves several separate needle insertions to acquire multiple samples, the special biopsy probe used during vacuum-assisted biopsy is inserted only once into the breast through a small skin nick made in the skin of the patient's breast.

Vacuum assisted breast biopsy devices have a needle with an aperture that is placed under or within the lesion of interest. A vacuum sucks tissue into the aperture and then the aperture closes to complete tissue acquisition. They tend to be larger needles and because of the vacuum usually obtain larger size tissue samples. Most of the vacuum assisted devices have a separate console that is hooked to the biopsy device with suction tubing. They are ideally used for all stereotactic and MRI guided core biopsies.

According to APO Research, The global Vacuum-assisted Biopsy Devices market was estimated at US\$ million in 2023 and is projected to reach a revised size of US\$ million by 2030, witnessing a CAGR of xx% during the forecast period 2024-2030.

North America is the largest region of Vacuum-assisted Biopsy Devices, with a market share more than 40%, It was followed by Europe with 30%. BD, Mammotome and Hologic are the top 3 manufacturers of industry, and they had a nearly 97% combined market share.
