### Summary

Completion, in petroleum production, is the process of making a well ready for production (or injection). This principally involves preparing the bottom of the hole to the required specifications, running in the production tubing and its associated downhole tools as well as perforating and stimulating as required. Sometimes, the process of running in and cementing the casing is also included.

This report covers traditional and intelligent completions equipment.

Between these, intelligent completions incorporate permanent downhole sensors and surface-controlled downhole flow control valves, enabling the operators to monitor, evaluate, and actively manage production (or injection) in real time without any well interventions. Data are transmitted to surface for local or remote monitoring.
