Abstracts

Winter tires are tires designed for use in colder weather, snow and ice. Winter tires have more sipes than summer tires, increasing traction on snow and ice. Tires designed for winter conditions are optimized to drive at temperatures below 7 °C (45 °F). They are an alternative to the use of snow chains.

Winter tires are usually tires with a different rubber composition from all-weather (all-season) tires. Cold-weather tires include a greater percentage of natural rubber and silica so there is not as much hardening as found in synthetic rubber in cold conditions: they provide better traction at lower temperatures. Winter tires provide more small-tread areas, increasing traction on snow and, in wet conditions, allowing water to escape from under the tire more easily. This reduces the risk of hydroplaning. Snow/winter tires start to perform better than summer or all-season tires if temperature falls below 7C (45F), as the rubber compounds in the latter harden resulting to decreasing grip even on dry pavement Interestingly one achieves maximum grip on packed snow if the slippage/wheel spin is 40-50%, i.e. one should turn off the traction control in most modern cars for maximum traction.

Studded tires with metal pins that protrude from the tire can greatly reduce skidding and accidents on snow or ice-covered roads. In much of Scandinavia, Canada, and the US, winter tires may have metal studs to improve grip on packed snow or ice, but such tires are prohibited in certain other jurisdictions because of the damage they cause to the road surface.

A tire is a ring-shaped vehicle component that covers the wheel's rim to protect it and enable better vehicle performance. Most tires, such as those for automobiles and

bicycles, provide traction between the vehicle and the road while providing a flexible cushion that absorbs shock.

The materials of modern pneumatic tires are synthetic rubber, natural rubber, fabric and wire, along with carbon black and other chemical compounds.
