Abstracts

A marine loading arm is equipment installed at the dock for loading and unloading petrochemical fluids or gases transported by oil tankers. Marine loading arms are an alternative to direct hose connections, and are particularly suitable for larger ships and for transshipment at higher loading rates and pressures. The manual or hydraulically controlled loading arm uses a rotary joint, which can follow the movement of the moored vessel to a certain extent. The loading arm can handle liquids and gases of various viscosities and temperatures.
