Summary

A microchip is a computer chip enclosed in a small glass cylinder (about the size of a grain of rice) that is injected under pet's skin as a means of identification. Each microchip is connected to an online registry of owner contact information. In the event that pet is lost and taken to a shelter or veterinary hospital, he will be scanned for a microchip. If the contact information on file is up to date, the pet's owner can be quickly notified and reunited with their pet. Microchipping a pet is a quick and simple procedure. The chip is inserted under a pet's skin, usually around the scruff of the neck, using a needle. It takes seconds. Pets can be checked for a microchip using a handheld electronic device, called a scanner. When this is waved over the PET's neck, the scanner will recognise the unique information held inside the chip. The microchips presently used in pets only contain identification numbers. No, the microchip is not a GPS device and cannot track your animal if it gets lost. Although the present technology microchip itself does not contain your pet's medical information, some microchip registration databases will allow you to store that information in the database for quick reference.
