Abstracts

When plastic strapping was introduced, it was only natural that it was looked upon as a substitute for steel strapping. In one respect, it was – especially in those applications where steel had been used only because there was nothing available. Often, the steel was over specification in the first case. The existence of plastic strapping widens the range of strapping and offers new opportunities. A more important plastic strapping consideration is elongation recovery. Once tension has been applied and the strap has elongated, how hard will the strap try to return to its original length? With plastic, time changes the recovery. If you have a rigid load, polyester might be best. However, because it doesn't elongate much, it doesn't have room to recover. On a shrinking-type load, this can be a problem. Since both nylon and polypropylene elongate more than polyester, and have more room to recover, they would both be better choices. If a high level of retained tension is important, nylon would be the preferred choice and if retained tension is not important, polypropylene's lower price may change the choice.
