Abstracts

PP nonwoven fabric is a thermoplastic material with excellent comprehensive performance; moreover, it is small in density, easy to produce and has low production costs. However, it also has some defects, such as a low melting point, low thermal deformation temperature, poor creep-resistant performance, poor dimensional stability, low temperature brittleness, etc.

On the other hand, PP nonwoven fabric itself is resistant to erosion by mildew, but it cannot directly kill it. Furthermore, its side-chain polymers have flexible molecule chains and are non-polar, with the latter attribute making it difficult to blend with other polymers, and the weak molecule combination making its heat resistance poor. Thus, in order to expand the functions of PP nonwoven fabrics, it is necessary to modify and process it.

According to APO Research, The global Polypropylene (PP) Nonwoven Fabric market was valued at US\$ million in 2023 and is anticipated to reach US\$ million by 2030, witnessing a CAGR of xx% during the forecast period 2024-2030.
