## Abstracts

The pulse tube refrigerator (PTR) or pulse tube cryocooler is a developing technology that emerged largely in the early 1980s with a series of other innovations in the broader field of thermoacoustics. In contrast with other cryocoolers (e.g. Stirling cryocooler and GM-refrigerators), this cryocooler can be made without moving parts in the low temperature part of the device, making the cooler suitable for a wide variety of applications.

Pulse tube cryocoolers are used in industrial applications such as semiconductor fabrication and in military applications such as for the cooling of infrared sensors. Pulse tubes are also being developed for cooling of astronomical detectors where liquid cryogenics are typically used, such as the Atacama Cosmology Telescope or the Qubic experiment (an interferometer for cosmology studies). PTRs are used as precoolers of dilution refrigerators. Pulse tubes will be particularly useful in space-based telescopes where it is not possible to replenish the cryogenics as they are depleted. It has also been suggested that pulse tubes could be used to liquefy oxygen on Mars.

According to APO Research, the global Pulse Tube Cryocoolers market was valued at US\$ million in 2023 and is anticipated to reach US\$ million by 2030, witnessing a CAGR of xx% during the forecast period 2024-2030.

Global Pulse Tube Cryocoolers main players are Sumitomo Heavy Industries, Chart Industries, Inc., Cryomech, Inc, Thales cryogenics, AIM, etc. Global top five manufacturers hold a share over 60%. North America is the largest market, with a share over 35%.
